

Systems from Forstner ensure lasting value.

Forstner, 1964

Forstner has been developing and manufacturing machines for professional processing of coils since 1960. Right from the beginning, easy handling of coils and building a long-term durable Forstner system has

been the prime objectives of all developmental work. The results are perfected, field-proven products, using reliable designs, thus ensuring a long operating life.

Forstner Coil Processing

Multiple decoiling lines

Cut to length lines

Straightening, slitting and cut to length lines

Slitting and recoiling lines

Duct lines for rectangular ducts

Tube lines for insulating and chimneys

Custom-made special machines for sheet processing

Coil Processing in perfection

Present throughout the world.

Since the mid-eighties, Renato Romagna has been managing the Forstner company. This high quality company, already well established at the time he took over, has since markedly improved its product line. Renato's additional know-how in the area of mechanical engineering and many

years of experience, particularly in the construction trade coil processing area have greatly contributed to the company and its products achieving even higher standards of efficiency and quality.

Today, machines from Forstner can be found on all continents. A dense network of independent representatives ensures optimum customer support both

throughout Europe and in many other areas around the world.

Professional assembly, prompt service, and careful maintenance are performances Forstner's customers can expect every day. Forstner's modern technical organisation enables documentation of even the most sophisticated machines for coil handling with detailed design drawings and parts lists. This means that even after many years, spare parts can be supplied and repairs can be made without any problem.

Whoever wants to work with sheet metal processing on a competitive level can always rely on the coil systems from Forstner to give them the edge over their competitors. The evaluation of the advantages offered means economical highly professional sheet processing which pays off right from the beginning!

There's more to say about sheet metal.

What could make processing of sheet metal easier, more flexible, and more economic?
 1. Use coils instead of sheet metal flat stock. 2. Process these coils with lines from Forstner.

Both advantages together means to secure a leading edge in your daily business. A lead which can pay off for small companies as well as large industrial enterprises.

The advantages are, indeed, quite obvious: better purchasing prices for coils, shorter processing time in manufacturing, high improved use of material, reduced risk of accidents, lower storage costs, constant precision, reduced working time and less personnel.

With sheet metal working machines from Forstner you can be assured of an optimal flexibility in production.

Straightening, slitting, and cut-to-length line

Slitting and recoiling line

Multiple decoiling line

Duct line for rectangular ducts

Each line is custom made to suit your specific needs.

The requirements of our coil lines are just as varied as the daily working practice of our customers. For this reason, Forstner lines are not available "off the shelf". On the basis of fundamental modular components for decoiling, straightening, slitting and cut to length, an optimised system is provided for each and every customer. Optimal in terms of performance. Optimal in terms of price.

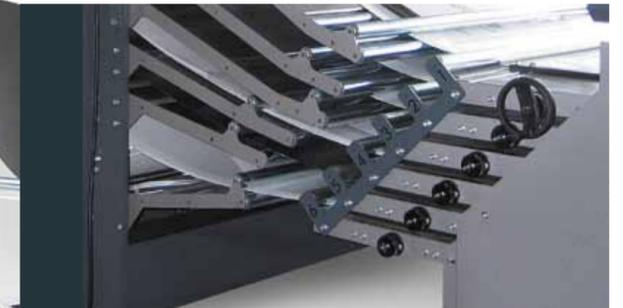

Flexibility is our supreme principle in designing new equipment. Forstner coil lines are built to process 80% of sheet metal used in a factory. In this way, thickness, material resistance, quality, width and painting are available "at one's fingertips".

The perfected PLC control unit, with its easy operation and short processing time, brings the best results in every aspect. One-man operation, operational safety, precision, flexibility, and no waste are thereby ensured.

Decoiling, straightening, slitting, ... expertly thought-out down to the least detail.

One to eight unpowered or powered decoilers from 300 up to 12000kg (26000lbs)

Automatic sheet change in less than one minute with one up to eight coil feeders

Straightening of the coil set with three or more straightening shafts

Slitting with one to ten pair of manual or programmable knives

Cutting to length with manual/electric slitter or guillotine and additional functions can be added for example recoiling

Simple operation and programming allows completing a single or multiple job with a touch panel
